Random variables

- We have a question about the world, so we collect data (sample from a population).
 - $y = (y_1, y_2, y_3, y_4, \dots, y_n)$
- We want to know how the data (the sample) was generated.
- In probability theory, data is generated by a random variable Y .

Random variables

- Y is uncertain.
 - We can describe Y as a probability distribution, expressed by a set of parameters $\Theta = (\theta_1, \dots, \theta_n)$.
- Probability distributions:
 - *Normal* (μ, σ) ,
 - *Binomial* (n, p) ,
 - ...

$$vot_i \sim Normal(\mu, \sigma)$$

$$voiced_i \sim Bernoulli(p)$$

$$DoubleDative_i \sim Poisson(\lambda)$$

Frequentist vs Bayesian view

- Parameters: $\mu, \sigma, p, \lambda, \dots$
- Frequentist view:
 - The parameters are **fixed** (they are unknown but certain).
 - They take on a specific value.
- Bayesian view:
 - The parameters are **random variables** (they are unknown and uncertain).
 - We describe each parameter as a probability distribution, expressed by a set of **hyperparameters**.

$$vot_i \sim Normal(\mu, \sigma)$$

$$\mu \sim Normal(\mu_1, \sigma_1)$$

$$\sigma \sim HalfCauchy(x_0, \gamma)$$

Bayes' Theorem

$$P(\theta \mid d) = \frac{P(d \mid \theta) P(\theta)}{P(d)}$$

Bayes' Theorem

$$\textit{posterior probability} = \frac{\textit{likelihood} \times \textit{prior}}{\textit{marginal likelihood}}$$

- We can incorporate previous knowledge about the hyperparameters as **priors** (prior distributions).
- Priors are chosen based on expert knowledge, previous studies, pilot data...
 - Priors must **not** be chosen based on the data to be analysed.

- Informative and weakly informative priors.
- Uninformative or diffuse priors.
 - Uniform distribution.
- Regularising priors.

Normal prior

[empirical rule]

- Previous literature on VOT in Italian (Esposito, 2002; Stevens & Hajek, 2010) report VOT values for voiceless stops in the range of 20–60 ms.
 - We can express this knowledge with the prior $\text{Normal}(40, 10)$.
 - This is a somewhat strongly informative prior.

Italian VOT

Italian VOT

$$vot_i \sim Normal(\mu, \sigma)$$

$$\mu \sim Normal(40, 10)$$

$$\sigma \sim HalfCauchy(x_0, \gamma)$$

Cauchy prior

Cauchy prior

HalfCauchy

$$vot_i \sim Normal(\mu, \sigma)$$

$$\mu \sim Normal(40, 10)$$

$$\sigma \sim HalfCauchy(0, 10)$$

- We have a model which incorporates (some of) our knowledge about VOT (through the priors for μ and σ).
- Now we want to obtain the **posterior distributions** of μ and σ .
 - The posterior distribution is the prior distribution *conditioned* on the data.
- **brms** R package: Bayesian Regression Models using Stan (Bürkner, 2018).

- Stan (Stan Development Team, 2017).
 - Statistical programming language written in C++ for fitting Bayesian models (calculate posterior distributions).
 - Calculation can be complex and/or impossible, so we take many samples from the data and from the possible parameter values to find the posterior distributions of the hyperparameters.
 - Markov Chain Monte Carlo (MCMC) sampling using the No-U-Turn sampler (NUTS).
- brms is an interface between R and Stan.
- **brm()** function from brms.
 - lme4 syntax ($y \sim x + (1|w)$).
 - Creates a Stan model, which is compiled and run.

```
library(brms)

vot1 <- brm(
  <model_formula>,
  <family>,
  <prior>,
  <data>,
  chains = 4,
  iter = 2000
)
```

```
library(brms)

vot1 <- brm(
  vot ~ 1,
  family = gaussian(),
  <prior>,
  data = ita_egg,
  chains = 4,
  iter = 2000
)
```

Get prior

```
get_prior(  
  vot ~ 1,  
  family = gaussian(),  
  data = ita_egg  
)
```

```
##           prior    class coef group resp dpar nlpar bo  
## 1 student_t(3, 19, 14) Intercept  
## 2 student_t(3, 0, 14)      sigma
```

Set prior

Prior predictive checks

```
nsim <- 1000  
nobs <- 100  
  
y <- matrix(rep(NA, nsim * nobs), ncol = nobs)  
  
mu <- rnorm(nsim, 40, 10)  
sigma <- rhcauchy(nsim, 10)  
  
for (i in 1:nsim) {  
  y[i,] <- rnorm(nobs, mean = mu[i], sd = sigma[i])  
}
```

Prior predictive checks

```
op <- par(mfrow = c(3, 3))
rand_sample <- sample(1:nsim, 9)

for (i in rand_sample) {
  plot(density(y[i,]), main = "")
}
```

Run the model

```
vot1 <- brm(  
  vot ~ 1,  
  family = gaussian(),  
  prior = priors,  
  data = ita_egg,  
  chains = 4,  
  iter = 2000,  
  file = "./cache/vot1"  
)
```

Model summary

```
vot1
```

```
## Family: gaussian
```

```
## Links: mu = identity; sigma = identity
```

```
## Formula: vot ~ 1
```

```
## Data: ita_egg (Number of observations: 2624)
```

```
## Samples: 4 chains, each with iter = 2000; warmup = 1000;
```

```
##           total post-warmup samples = 4000
```

```
##
```

```
## Population-Level Effects:
```

```
##           Estimate Est.Error l-95% CI u-
```

```
95% CI Rhat Bulk_ESS Tail_ESS

```
## Intercept    23.06      0.30   22.47   23.65 1.00   3219
```

```
##
```

```
## Family Specific Parameters:
```

Plot model

```
plot(vot1)
```

Posterior predictive check

```
pp_check(vot1, nsamples = 100)
```

Adding predictors

$$vot_i \sim Normal(\mu_i, \sigma)$$

$$\mu_i = \alpha + \beta_1 \times coronal_i + \beta_2 \times velar_i$$

$$\alpha \sim Normal(\mu_1, \sigma_1)$$

$$\beta_1 \sim Normal(\mu_2, \sigma_2)$$

$$\beta_2 \sim Normal(\mu_3, \sigma_3)$$

$$\sigma \sim HalfCauchy(x_0, \gamma)$$

Adding predictors

$$vot_i \sim Normal(\mu_i, \sigma)$$

$$\mu_i = \alpha + \beta_1 \times coronal_i + \beta_2 \times velar_i$$

$$\alpha \sim Normal(25, 10)$$

$$\beta_1 \sim Normal(10, 10)$$

$$\beta_2 \sim Normal(20, 10)$$

$$\sigma \sim HalfCauchy(0, 10)$$

Get prior

```
##           prior      class      coef group resp dpar n
## 1                                b
## 2                                b c1_placecoronal
## 3                                b   c1_placevelar
## 4 student_t(3, 19, 14) Intercept
## 5  student_t(3, 0, 14)      sigma
```

Set prior

Run the model

```
vot2 <- brm(  
  vot ~ 1 + c1_place,  
  family = gaussian(),  
  prior = priors,  
  data = ita_egg,  
  chains = 4,  
  iter = 2000,  
  file = "./cache/vot2"  
)
```

Random effects

$$vot_i \sim Normal(\mu_i, \sigma)$$

$$\mu_i = \alpha + \alpha_{speaker[i]} + (\beta_1 + \beta_{1speaker[i]}) \times coronal_i + (\beta_2 + \beta_{2speaker[i]}) \times velar_i$$

$$\begin{bmatrix} \alpha_{speaker} \\ \beta_{1speaker[i]} \\ \beta_{2speaker[i]} \end{bmatrix} \sim Normal\left(\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}, S\right)$$

$$\alpha \sim Normal(25, 10)$$

$$\beta_1 \sim Normal(10, 10)$$

$$\beta_2 \sim Normal(20, 10)$$

$$\sigma_{\alpha speaker} \sim Normal(0, \sigma_{speaker})$$

$$\sigma_{\beta 1 speaker} \sim HalfCauchy(0, 10)$$

Random effects

```
##          prior    class      coef  group resp dpa
## 1                                b
## 2                                b c1_placecoronal
## 3                                b  c1_placevelar
## 4                                lkj(1)      cor
## 5                                cor          speaker
## 6 student_t(3, 19, 14) Intercept
## 7 student_t(3, 0, 14)          sd
## 8                                sd          speaker
## 9                                sd c1_placecoronal speaker
## 10                               sd  c1_placevelar speaker
## 11                               sd      Intercept speaker
## 12 student_t(3, 0, 14)          sigma
```

Random effects

Random effects

```
vot3 <- brm(  
  vot ~ 1 + c1_place + (1 + c1_place | speaker),  
  family = gaussian(),  
  prior = priors,  
  data = ita_egg,  
  chains = 4,  
  iter = 2000,  
  file = "./cache/vot3"  
)
```
